

CO2 Laser Resurfacing - Skin Rejuvenation

What is CO2 Laser Resurfacing?

CO2 laser resurfacing uses a carbon dioxide laser to vaporize thin layers of skin, creating a controlled injury that stimulates collagen production. This process restores skin elasticity and is effective in minimizing wrinkles, reducing facial scarring, evening out skin tone, and increasing dermal collagen.

Ideal Candidates

- Best for those with lines, wrinkles, superficial scars.
- More effective on lighter skin tones.

Procedure

- Destroys outer skin layer, heats underlying skin.
- Stimulates collagen for improved skin texture.

Side Effects

- Common: swelling, redness, irritation.
- Rare: scarring, pigmentation changes.

Recovery

- Typically 10-21 days for healing.
- Redness fades in 2-3 months.

Results

- Immediate improvement, long-lasting effects.

Post-Care

- Use sunscreen and moisturizers.
- Avoid sun exposure and smoking before and after treatment.
